Hydroxypropyl Methylcellulose

Specifications: 1.0 ml, 1.5 ml, 2.0 ml

pH: ~6.8~7.6

Dynamic Viscosity: 5,000-15,000 mPas

Hydroxypropyl methylcellulose (UV-Gel) is a transparent viscoelastic solution of high viscidity made of non-protein polymeric carbohydrate, with the pH value of 6.87.6, approaching the physical pH of the human boby, and the dynamic viscosity is 5,000-15,000mpas, which is used in cataract extraction and intraocular lens implantation surgeries to maintain a deep chamber during anterior segment surgeries and coat the operation instruments and in other eye surgeries.

Characteristics of Hydroxypropyl Methylcellulose (UV-Gel):

1. HPMC is made of pure natural plant cellulose which is transparent, odourless, compatible, non-protein and free of causing inflammation.
2. It has low surface stress and easily spreads and can protect ophthalmology structures and corneal endothelium from being damaged during operation with stable anterior space to satisfy the successful surgery.
3. HPMC has a low molecular weight and fine hydrated nature; 98% of the HPMC residual can discharge from the trabecula net.
4. It is stored at normal temperature and needless of cold keeping.
